# A Formal, One-Pot $\beta$ -Chlorination of Primary Alcohols and Its Utilization in the Transformation of Terpene Feedstock and the Synthesis of a $C_2$ -Symmetrical Terminal Bis-Epoxide

Jörg Swatschek,<sup>†</sup> Lydia Grothues,<sup>†</sup> Jonathan O. Bauer,<sup>‡</sup> Carsten Strohmann,<sup>‡</sup> and Mathias Christmann\*,<sup>†</sup>

<sup>†</sup>Institute of Chemistry and Biochemistry, Organic Chemistry, Freie Universität Berlin, Takustrasse 3, 14195 Berlin, Germany <sup>‡</sup>Department of Chemistry and Chemical Biology, Technische Universität Dortmund, Otto-Hahn-Strasse 6, 44227 Dortmund, Germany

Supporting Information

ABSTRACT: A one-pot transformation of alkan-1-ols into 2-chloroalkan-1-ols is described. As a practical application, terpene-derived primary alcohols were converted into semiochemicals such as olfactory lactones (aerangis lactone, whisky lactone, and cognac lactone) and pheromones (cruentol and ferrugineol). Using heptane-1,7-diol as a bifunctional substrate, the corresponding bis-epoxide was synthesized by bidirectional synthesis in good yield and high enantioselectivity.

#### ■ INTRODUCTION

The conversion of biomass into high-value chemicals is a central goal in catalysis.<sup>2</sup> In recent years, terpenes have been utilized increasingly as feedstock<sup>3</sup> for the synthesis of biologically active natural products,<sup>4</sup> fragrance compounds,<sup>5</sup> and fine chemicals.<sup>6</sup> The key methodological challenge in this approach is to achieve site-selective functionalization of the terpene scaffold, thereby allowing for subsequent C-C coupling reactions. To this end, our group has developed protocols for the conversion of terpene aldehydes into the corresponding 1,2-epoxides<sup>7</sup> as well as an allylic substitution of terpene acetates with vinyl nucleophiles to give 1,4-dienes.8 Taking advantage of both methods, we have assembled a major part of ripostatin B's polyketide backbone from two molecules of geranyl acetate.9

Herein, we describe the development of a telescoped oxidation-chlorination-reduction and its application to the conversion of primary alcohols into enantioenriched 1,2epoxides and a C2-symmetrical terminal bisepoxide via chlorohydrin intermediates. Using terpene-derived alcohols as substrates has allowed us to synthesize a range of semiochemicals while bisepoxides might prove useful in the bidirectional synthesis of polyols.

Halogen-bearing chiral centers 10 constitute a useful handle for subsequent transformations, and halogenation of carbonyl compounds<sup>11</sup> provides a highly stereoselective entry into this substrate class. In particular,  $\alpha$ -haloaldehydes represent versatile building blocks for heterocyclic scaffolds<sup>12</sup> and for natural product synthesis. 13 For example, the Britton group has demonstrated the broad utility of  $\alpha$ -chloroaldehydes in the synthesis of carbohydrates, 14 alkaloids, 15 and acetogenins. 16

The merging of the oxidation and the chlorination step into a single reaction vessel (one-pot reaction)<sup>17</sup> obviates the need to isolate and purify possibly unstable aldehyde intermediates. For this purpose, a mild oxidation protocol was sought that would not interfere with the rather sensitive subsequent organocatalytic chlorination step. In this sense, harsh reaction conditions and reactive stoichiometric byproducts from the terminal oxidant were to be avoided. In 2011, Hoover and Stahl<sup>18</sup> reported a mild protocol for the Cu-catalyzed aerobic oxidation 19 of primary alcohols to aldehydes based on pioneering work by Semmelhack, 20 Markó, 21 Sheldon, 22 and Koskinen. 23 With water as the only stoichiometric byproduct, we envisioned this protocol to be an ideal starting point for telescoping an oxidation with subsequent organocatalytic transformations.<sup>24</sup> In a proof-of-concept study, we joined Stahl's oxidation conditions with a DMAP-catalyzed isomerization and an organocatalytic Diels-Alder reaction, 25 while Jang et al. reported a similar oxidation in conjunction with an organocatalytic Michael addition/oxyamination.<sup>26</sup>

# RESULTS AND DISCUSSION

Before we investigated the one-pot reaction, the conditions for the organocatalytic  $\alpha$ -chlorination<sup>27</sup> were optimized for citronellal (1a) as the substrate. Our previously described procedure is based on the work of Jørgensen<sup>28,29</sup> and MacMillan<sup>30,31</sup> and employs catalyst 2<sup>32</sup> together with Nchlorosuccinimide (NCS) as an inexpensive chlorine source. The screening of the  $\alpha$ -chlorination was carried out using (R)citronellal with 96% ee, and the sensitive  $\alpha$ -chloroaldehyde was converted to the corresponding alcohol by in situ reduction with sodium borohydride (Table 1). While the reaction exhibited high diastereoselectivity over a wide temperature range, between 23 and 0 °C the isolation of pure (2S,3R)-3a was hampered by the formation of unidentified side products.

Received: November 1, 2013 Published: January 17, 2014

Table 1. Optimized Organocatalytic  $\alpha$ -Chlorination of Citronellal<sup> $\alpha$ </sup>

 $^a$ 30 mol % **2**·TFA, 1.30 equiv of NCS, then 2.50 equiv of NaBH<sub>4</sub>, 0  $^{\circ}$ C.  $^b$ ee of the major diastereomer.  $^c$ ent-**2** (30 mol %) was used.

This problem was circumvented efficiently by lowering the temperature to -15 °C. Accordingly, the alcohol (2*S*,3*R*)- **3a** was isolated in 73% yield with >99% ee. The *syn/anti* ratio of 98:2 reflects the 96% *ee* of the starting material. Using the enantiomeric MacMillan catalyst *ent*-**2** at -28 °C afforded the *anti*-diastereomer (2*R*,3*R*)-4a in a 98:2 ratio in >99% *ee*. From these results we conclude that the  $\alpha$ -chlorination appears to be catalyst-controlled.

We next turned our attention to the possibility of employing alcohols as substrates in a three-step one-pot sequence consisting of oxidation,  $\alpha$ -chlorination, and reduction. Exploratory experiments indicated that reagents for the Cu-catalyzed aerobic oxidation do not interfere with chlorination. As shown in Table 2, the reactions using alcohols  $\mathbf{5a-c}$  proceeded smoothly and were completely catalyst-controlled. The low *anti/syn* ratio of  $\mathbf{4b}$  is a direct consequence of the low *ee* of the

Table 2. Scope of the Telescoped Oxidation—Chlorination—Reduction Sequence  $^a$ 

starting alcohol (5b). Treatment of the chlorohydrins 4a-c with NaOH afforded the corresponding terminal epoxides 6a-c in 93-97% yield.

The epoxide function (a²-synthon) is a useful handle for carbon chain extension. With the optimized procedure in hand, we next demonstrated the utility of monoterpene-derived 1,2-epoxides as chiral building blocks. Apart from the Roche ester,<sup>33</sup> citronellol is one of only a few viable resources for transferring methyl group bearing stereogenic centers from the chiral pool into target molecules and that is readily available in both enantiomeric forms. While citronellol's trisubstituted double bond represents a masked carbonyl group, the primary hydroxyl group can be transformed into a chiral 1,2-epoxide via one-pot oxidation—chlorination.

Thus, the citronellol-derived epoxide **6a** was converted into the main odor component of the African orchids *Aerangis kirkii* and *A. confusa*, (-)-cis-aerangis lactone **8**,<sup>34</sup> in just two synthetic steps.<sup>35–40</sup> As shown in Scheme 1, a Cu-catalyzed

Scheme 1. Synthesis of (-)-cis-Aerangis Lactone

regioselective opening of **6a** with *n*-butyllithium using CuCN (20 mol %) as the catalyst afforded **7a** in 89% yield. Using Marshall's ozonolytic esterification <sup>41</sup>/lactonization <sup>42</sup> protocol, (–)-*cis*-aerangis lactone **8** was obtained in 83% yield.

Alternatively, **6a** can be converted into palm weevil pheromones. Epoxide opening with Grignard reagent derived cuprates afforded the alcohols **7b** and **7c** in good yields. Acetylation of the hydroxyl group was followed by an ozonolysis with a reductive workup to give the primary alcohols **9b** and **9c**. Finally, tosylation and global reduction completed the synthesis of cruentol<sup>44</sup> **10b** and ferrugineol<sup>45,46</sup> **10c** (Scheme 2).

In a similar vein, 1,2-epoxydiene **6c** was subjected to a CuCN-catalyzed opening with n-BuLi and n-propylmagnesium bromide, respectively to afford the alcohols **11a** (81%) and **11b** (74%). A reductive ozonolysis was followed by an oxidative lactonization and yielded cognac lactone<sup>47–52</sup> (**12a**, R = n-Bu, 77%) and whisky lactone<sup>53–57</sup> (**12b**, R = n-Pr, 73%), two major flavor contributing constituents of most alcoholic beverages aged in smoked oak or other wooden casks.<sup>58</sup> Moreover, avoidance of the isolation of the labile and volatile aldehyde proved time-saving and led to satisfactory overall yields (Scheme 3).

Two-directional chain extension<sup>59</sup> is a multibond forming approach<sup>60</sup> to molecules with repeating functional group patterns. While this strategy has been applied to various achiral, prochiral,<sup>61</sup> meso- and  $C_2$ -symmetrical substrates,<sup>62</sup> examples of regioselective double opening of  $C_2$ -symmetrical terminal bis-epoxides with C-nucleophiles are scarce.<sup>63</sup> The currently established synthesis of  $C_2$ -symmetrical bis-epoxides involves peracid-mediated double epoxidation of two terminal

 $<sup>^</sup>a5.0$  mol % CuOTf, 5.0 mol % 2,2′-bipyridine, 5.0 mol % TEMPO, 10 mol % NMI (1-methylimidazole), rt, then 30 mol % 2·TFA, 1.30 equiv of NCS,  $-28\,$  °C, then 2.50 equiv of NaBH<sub>4</sub>, 0 °C; 22.3 equiv of NaOH, rt.

Scheme 3. Synthesis of Whisky Lactone and Cognac Lactone

alkene moieties<sup>64</sup> followed by hydrolytic kinetic resolution<sup>65</sup> of the resulting meso/rac-mixture. 66,67 As a consequence, the theoretical yield is limited to 25% of either of the two enantiomeric C2-symmetrical bis-epoxides and 50% of the mesodiastereomer. To test the hypothesis whether a formal double chlorination of symmetrical diols would serve as an entry into  $C_2$ -symmetrical bis-epoxides, we subjected 1,7-heptanediol (13) to the previously established conditions. Gratifyingly, the (2S,6S)-2,6-dichloroheptane-1,7-diol (14) was obtained as a crystalline solid in good yield and selectivity. The high enantiomeric excess of the C2-symmetrical diastereomer is due to the fact that the minor enantiomer in the first chlorination is preferentially converted to the meso-diastereomer in the second chlorination (Horeau principle).<sup>68</sup> The minor meso-isomer can be removed efficiently by recrystallization. Treatment of 14 with NaOH in dichloromethane affords the desired bisepoxide 15 in 92% yield and >99% enantiomeric excess (Scheme 4).

## CONCLUSION

In summary, we have demonstrated that alkan-1-ols can be converted to the corresponding 2-chloroalkan-1-ols in an efficient one-pot procedure involving a Cu-catalyzed oxidation and an enamine chlorination/reduction. Using terpene derived alcohols as feedstock, several chiral semiochemicals have been synthesized in an efficient manner via the corresponding 1,2-epoxides. Application of this telescoped sequence to bisepoxides in the bidirectional synthesis of more complex targets will be the subject of forthcoming reports from our laboratory.

# **■ EXPERIMENTAL SECTION**

(2R,3R)-2-Chloro-3,7-dimethyloct-6-en-1-ol 4a. To a solution of (R)-citronellal 1a (135 mg, 0.88 mmol) in MeCN (1.75 mL) (2S,5R)-2-(tert-butyl)-3,5-dimethylimidazolidin-4-one-TFA-salt (74.8 mg, 0.30 mmol, 0.30 equiv) and NCS (152 mg, 0.65 mmol, 1.30 equiv) were added successively at -28 °C. The reaction was stirred for 8 h at -28 °C and warmed to 0 °C. After the addition of EtOH (1.0 mL) and NaBH<sub>4</sub> (82.8 mg, 2.50 mmol, 2.50 equiv) the reaction was stirred for 30 min at 0  $^{\circ}\text{C}$ , quenched by the addition of a saturated aqueous solution of NH<sub>4</sub>Cl (2 mL), and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3  $\times$  5 mL). The combined organic layers were dried over MgSO<sub>4</sub> and concentrated under reduced pressure. The crude product was purified by column chromatography on silica (n-pentane/Et<sub>2</sub>O = 25:1), and 4a was obtained as a colorless liquid (136 mg, 82%, 98:2 dr, >99:1 er).  $[\alpha]_{D}^{20} = +16.7$  (c 0.75, CHCl<sub>3</sub>); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  5.09 (t, J = 7.1 Hz, 1H), 3.98 (ddd, J = 8.3, 5.1, 3.8 Hz, 1H), 3.71-3.85 (m,2H), 2.04-2.13 (m, 2H), 1.88-1.99 (m, 2H), 1.69 (s, 3H), 1.61 (s, 3H), 1.52-1.60 (m, 1H), 1.27-1.35 (m, 1H), 1.03 (d, J = 6.9 Hz, 3H);  ${}^{13}$ C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  132.0, 123.9, 71.0, 64.9, 36.3, 32.7, 25.7, 25.3, 17.7, 16.3; IR 3375, 2965, 2928, 2877, 2858, 1455, 1379, 1259, 1199, 1071, 1031, 987, 953, 824, 669 cm<sup>-1</sup>; HRMS (EI) m/z calcd for C<sub>10</sub>H<sub>19</sub>OCl [M]<sup>++</sup> 190.11189, found 190.11225; calcd for C<sub>10</sub>H<sub>19</sub>O<sup>37</sup>Cl [M]<sup>•+</sup> 192.10894, found 192.10772; GC (Hydrodexβ-TBDM, 130 °C isotherm, 1.1 mL/min He, 50:1 split)  $T_{(2R,3R)} = 25.5$ min,  $T_{(2S,3R)} = 26.4$  min,  $T_{(2R,3S)} = 29.6$  min,  $T_{(2S,3S)} = 31.2$  min, isomeric ratio = 70:1:1:0.

(2S,3S)-2-Chloro-3,7-dimethyloct-6-en-1-ol 4a (One-Pot Procedure). To a solution of (S)-citronellol 5a (3.12 g, 20 mmol) in MeCN (20 mL) were added solutions of CuOTf-4MeCN (377 mg, 0.05 mmol, 0.05 equiv), 2,2'-bipyridine (156 mg, 0.05 mmol, 0.05 equiv), TEMPO (156 mg, 0.05 mmol, 0.05 equiv), and 1methylimidazole (164 mg, 0.10 mmol, 0.10 equiv) each in 20 mL of MeCN. The reaction mixture was degassed for 5 min, the atmosphere in the reaction vessel was replaced by O2, and the reaction mixture was stirred for 2 h at rt. After the reaction was cooled to -28 °C, (2R,5S)-2-(tert-butyl)-3,5-dimethylimidazolidin-4-one-TFA-salt (1.60 g, 6.00 mmol, 0.30 equiv) and NCS (3.47 g, 26.0 mmol, 1.30 equiv) were added successively, and the reaction was stirred 24 h at −28 °C and warmed to 0 °C. After the addition of EtOH (50 mL) and NaBH<sub>4</sub> (189 g, 50.0 mmol, 2.50 equiv) the reaction was stirred for 30 min at 0 °C, quenched by the addition of a saturated aqueous solution of NH<sub>4</sub>Cl (100 mL), and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 × 100 mL). The combined organic layers were dried over MgSO<sub>4</sub> and concentrated under reduced pressure. The crude product was purified by column chromatography on silica (n-pentane/Et<sub>2</sub>O = 10:1), and 4a was directly submitted to the following reaction conditions.

Alternatively after column chromatography on silica (n-pentane/  $Et_2O = 35:1-25:1-15:1$ ), 4a can be obtained as a colorless liquid (3.05 g, 79%, 98:2 dr, >99:1 er).

[ $\alpha$ ]<sub>50</sub> = -13.5 (c 1.09, CHCl<sub>3</sub>); GC (Hydrodex- $\beta$ -TBDM, 130 °C isotherm, 1.1 mL/min He, 50:1 split)  $\tau$ <sub>(2R,3R)</sub> = 25.5 min,  $\tau$ <sub>(2S,3R)</sub> = 26.4 min,  $\tau$ <sub>(2R,3S)</sub> = 29.6 min,  $\tau$ <sub>(2S,3S)</sub> = 31.2 min, isomeric ratio = 0:1:1:83.

(25,35,E)-2-Chloro-3,7,11-trimethyldodeca-6,10-dien-1-ol **4b.** The same procedure as above was applied to ( $S_{e}E$ )-dihydrofarnesol **5b** (449 mg, 2.00 mmol). The crude product was purified by column chromatography on silica (n-pentane/Et<sub>2</sub>O = 35:1), and **4b** 

was obtained as a colorless liquid (444 mg, 86%, 58:42 dr, 90:10 er).  $[\alpha]_D^{20} = -9.64^\circ$  (c 1.03, CHCl<sub>3</sub>); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  5.10 (d, J = 6.0 Hz, 2H), 4.11–4.02 (m, 1H), 3.86–3.79 (m, 2H), 1.87–2.13 (m, 8H), 1.69 (s, 3H), 1.61 (m, 7H), 1.28–1.38 (m, 1H), 1.04 (d, J = 6.8 Hz, 1/2 3H), 0.98 (d, J = 6.7 Hz, 1/2 3H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  135.6, 135.6, 131.4, 131.3, 124.2, 124.2, 123.8, 123.7, 71.1, 70.2, 65.7, 64.9, 39.7 (2C), 36.3, 35.3, 34.2, 32.7, 26.6 (2C), 25.7 (2C), 25.2, 25.1, 17.7 (2C), 16.3, 16.0 (2C), 14.6; IR 3387, 2965, 2926, 2856, 1667, 1452, 1380, 1107, 1074, 1030, 831, 669 cm<sup>-1</sup>; HRMS (ESI) m/z calcd for C<sub>15</sub>H<sub>29</sub>OCl [M+H]<sup>+</sup> 259.18232, found 259.18244; calcd for C<sub>15</sub>H<sub>29</sub>O<sup>37</sup>Cl [M+H]<sup>+</sup> 261.17937, found 261.17944; GC (Lipodex E, 130 °C isotherm, 1.1 mL/min He, 20:1 split) T<sub>(2R,3R)</sub> = 83.0 min, T<sub>(2S,3R)</sub> = 90.1 min, T<sub>(2R,3S)</sub> = 97.6 min, T<sub>(2S,3S)</sub> = 105.0 min, isomeric ratio = 1:1:20:14.

(2S,3S,E)-2-Chloro-3,7-dimethylocta-5,7-dien-1-ol 4c. The same procedure as above was applied to (S,E)-3,7-dimethylocta-5,7dien-1-ol 5c (425 mg, 2.75 mmol) with a reaction temperature of 50 °C for the oxidation. The crude product was purified by column chromatography on silica (n-pentane/Et<sub>2</sub>O = 15:1), and 4c was obtained as a colorless liquid (422 mg, 82%, 95:5 dr, 98:2 er).  $[\alpha]_D^{20}$  =  $-20.8^{\circ}$  (c 1.12, CHCl<sub>3</sub>); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  6.19 (d, I =15.4 Hz, 1H), 5.59 (dt, *J* = 15.4, 7.4 Hz, 1H), 4.90 (s, 2H), 3.97 (ddd, *J* = 7.4, 6.2, 3.5 Hz, 1H), 3.74–3.89 (m, 2H), 2.36–2.43 (m, 1H), 2.01– 2.17 (m, 3H), 1.84 (d, J = 0.8 Hz, 3H), 1.03 (d, J = 6.7 Hz, 3H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  141.7, 135.3, 127.2, 115.1, 70.1, 64.9, 37.1, 36.2, 18.6, 16.5; IR 3382, 3080, 3019, 2967, 2937, 1646, 1608, 1454, 1378, 1310, 1136, 1073, 967, 885 cm<sup>-1</sup>; HRMS (EI) m/z calcd for C<sub>10</sub>H<sub>17</sub>OCl [M]<sup>•+</sup> 188.09624, found 188.09702; calcd for C<sub>10</sub>H<sub>17</sub>O<sup>37</sup>Cl [M]<sup>•+</sup> 190.09329, found 190.09356; GC (Lipodex E, 100 °C isotherm, 1.1 mL/min He, 20:1 split)  $T_{(2R,3R)} = 42.7$  min,  $T_{(2S,3R)} = 44.7 \text{ min, } T_{(2R,3S)} = 63.5 \text{ min, } T_{(2S,3S)} = 71.7 \text{ min, isomeric ratio}$ = 1:2:357:20.

(S,E)-3,7-Dimethylocta-5,7-dien-1-ol 5c. To a solution of SeO<sub>2</sub> (140 mg, 1.26 mmol, 0.05 equiv) and salicylic acid (348 mg, 2.52 mmol, 0.10 equiv) in CH<sub>2</sub>Cl<sub>2</sub> (12 mL) at rt, t-BuOOH (70% in H<sub>2</sub>O, 15.6 mL, 114 mmol, 4.50 equiv) was added slowly. After 15 min (S)citronellol 5a (5.00 g, 25.2 mmol) was added and stirred 48 h at rt. SeO<sub>2</sub> (140 mg, 1.26 mmol, 0.05 equiv) was added and stirred for another 72 h at rt. The reaction was quenched by the addition of MeOH (25 mL) and a saturated aqueous solution of Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (40 mL). After 1 h of stirring at rt the reaction was filtered and extracted with Et<sub>2</sub>O (3  $\times$  50 mL), the combined organic layers were washed with an aqueous solution of NaOH (1 M, 200 mL), and the basic aqueous layer was washed with Et<sub>2</sub>O (1 × 100 mL). The combined organic layers were washed with a saturated aqueous solution of NH<sub>4</sub>Cl (1 × 150 mL), dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated under reduced pressure. The crude product was solved in dry MeOH (25 mL) and cooled to 0 °C, and NaBH<sub>4</sub> (2.39 g, 63.0 mmol, 2.5 equiv) was added successively. After stirring for 1 h at 0 °C the reaction was quenched by the addition of a saturated aqueous solution of NH<sub>4</sub>Cl (25 mL) and extracted with  $CH_2Cl_2$  (3 × 50 mL). The combined organic layers were dried over Na2SO4 and concentrated under reduced pressure. The crude product was purified by column chromatography on silica (n-pentane/EtOAc = 3:1-2:1-1:1-0:1), and (S,E)-2,6-dimethyloct-2-en-1,8-diol was obtained as a colorless liquid (3.69 g, 66%).

To a solution of (S,E)-2,6-dimethyloct-2-en-1,8-diol (2.88 g, 16.7 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> (17 mL) at 0 °C were added Et<sub>3</sub>N (6.13 mL, 44.2 mmol, 2.64 equiv), DMAP (205 mg, 1.67 mmol, 0.10 equiv), and Ac<sub>2</sub>O (3.80 mL, 40.18 mmol, 2.40 equiv) and stirred for 1.5 h at 0 °C. The reaction was quenched by the addition of a saturated aqueous solution of NaHCO<sub>3</sub> (20 mL) and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 × 50 mL), and the combined organic layers dried over MgSO<sub>4</sub> and concentrated under reduced pressure. The crude product was purified by column chromatography on silica (n-pentane/EtOAc = 30:1), and (S,E)-2,6-dimethyloct-2-en-1,8-diyldiacetate was obtained as a colorless liquid (4.20 g, 98%).

To a solution of (S,E)-2,6-dimethyloct-2-en-1,8-diyldiacetate (1.28 g, 5.00 mmol) in dry THF (15 mL) at rt were added ZnCl<sub>2</sub> (682 mg, 5.00 mmol, 1.00 equiv) and Pd(PPh<sub>3</sub>)<sub>4</sub> (57.8 mg, 0.05 mmol, 0.01

equiv). Over 30 min AllylMgCl (1.7 M in Et<sub>2</sub>O, 5.88 mL, 10.0 mmol, 2.00 equiv) was added, and the reaction was stirred 1.5 h at rt. The reaction was quenched by the addition of a saturated aqueous solution of NH<sub>4</sub>Cl-Lsg. (10 mL) and H<sub>2</sub>O (20 mL) and extracted with CH<sub>2</sub>Cl<sub>2</sub>  $(3 \times 35 \text{ mL})$ , and the combined organic layers were dried over MgSO<sub>4</sub> and concentrated under reduced pressure. The crude product was solved in MeOH (5 mL) at rt, and K<sub>2</sub>CO<sub>3</sub> (1.83 g, 12.5 mmol, 2.50 equiv) was added and stirred 17 h at rt. The reaction was quenched by the addition of a saturated aqueous solution of NH<sub>4</sub>Cl-Lsg. (2.5 mL) and extracted with Et<sub>2</sub>O (3 × 15 mL), and the combined organic layers were dried over  $MgSO_4$  and concentrated under reduced pressure. The crude product was purified by column chromatography on silica (n-pentane/EtOAc = 25:1), and 5c was obtained as a colorless liquid (612 mg, 80%). (65,75,E)-7,11-Dimethyldodeca-9,11-dien-6-ol 11b. The same procedure to synthesize 7a was applied to 6c (158 mg, 1.04 mmol).

The crude product was purified by column chromatography on silica (n-pentane/EtOAc = 250:1), and 11b (178 mg, 81%, 96:4 dr) was obtained as a colorless liquid. [ $\alpha$ ] $_{\rm D}^{20}$  = -12.7 (c 1.13, CHCl $_{\rm 3}$ );  $^{1}$ H NMR (400 MHz, CDCl $_{\rm 3}$ ):  $\delta$  6.17 (d, J = 15.6 Hz, 1H), 5.61–5.68 (m, 1H), 4.87 (s, 2H), 3.53 (td, J = 6.1, 3.7 Hz, 1H), 2.23–2.30 (m, 1H), 2.02 (dt, J = 14.5, 7.5 Hz, 1H), 1.84 (s, 3H), 1.57–1.66 (m, 1H), 1.40–1.47 (m, 4H), 1.26–1.35 (m, 6H), 0.87–0.92 (m, 6H);  $^{13}$ C NMR (100 MHz, CDCl $_{\rm 3}$ ):  $\delta$  141.9, 134.2, 129.2, 114.4, 74.6, 38.5, 36.9, 34.5, 31.9, 25.9, 22.6, 18.7, 14.0, 13.3; IR 3379, 2958, 2929, 2860, 1608, 1457, 1377, 1124, 1017, 965, 881 cm $^{-1}$ ; HRMS (ESI) calcd for C $_{\rm 14}$ H $_{\rm 27}$ O [M + H] $^{+}$  211.20564, found 211.20571.

(4S,5S)-5-Butyl-4-methyldihydrofuran-2(3H)-one 12a, (-)-cis-Whisky Lactone. A solution of 11a (80.0 mg, 0.40 mmol) in MeOH (5 mL) was cooled to -78 °C, ozone enriched O2 was bubbled through the solution until it turned blue, following by stirring for 5 min, and air was bubbled through the solution until the blue color disappeared. The reaction was quenched by the addition of NaBH<sub>4</sub> (36.3 mg, 0.96 mmol, 2.40 equiv), stirred for 1 h while warming up to rt, and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 × 5 mL), and the combined organic layers were dried over MgSO<sub>4</sub> and concentrated under reduced pressure. The crude product was solved in MeCN (1 mL), and solutions of CuOTf·4MeCN (7.54 mg, 0.02 mmol, 0.05 equiv), 2,2'-bipyridine (3.13 mg, 0.02 mmol, 0.05 equiv), TEMPO (3.13 mg, 0.02 mmol, 0.05 equiv), and 1-methylimidazole (3.29 mg, 0.04 mmol, 0.10 equiv) each in MeCN (1 mL) were added. The reaction mixture was degassed for 5 min, the atmosphere in the reaction vessel was replaced by O<sub>2</sub>, and the reaction was stirred for 2 h at 50 °C, quenched by the addition of H<sub>2</sub>O (1 mL), and extracted with  $CH_2Cl_2$  (3 × 5 mL); the combined organic layers were dried over MgSO<sub>4</sub> and concentrated under reduced pressure. The crude product was purified by column chromatography on silica (n-pentane/Et<sub>2</sub>O = 5:1), and 12a was obtained as a colorless liquid (50.0 mg, 73%, 98:2 dr).  $[\alpha]_D^{20} = -59.2^{\circ}$  (c 1.18, CHCl<sub>3</sub>); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$ 4.39-4.44 (m, 1H), 2.68 (dd, J = 17.0, 7.8 Hz, 1H), 2.53-2.61 (m, 1H), 2.18 (dd, J = 17.0, 4.0 Hz, 1H), 1.59-1.69 (m, 1H), 1.43-1.55(m, 2H), 1.29-1.40 (m, 3H), 1.00 (d, J = 7.1 Hz, 3H), 0.91 (t, J = 7Hz, 3H);  ${}^{13}$ C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  176.8, 83.6, 37.5, 32.9, 29.5, 28.0, 22.4, 13.8, 13.8; IR 3523, 2958, 2873, 1774, 1465, 1422, 1383, 1336, 1293, 1209, 1170, 1092, 1080, 994, 974, 940, 928 cm<sup>-1</sup>; HRMS (ESI) m/z calcd for  $C_9H_{17}O_2[M + H]^+$  157.12231, found 157.12216.

(45,55)-4-Methyl-5-pentyldihydrofuran-2(3*H*)-one 12b, (–)-*cis*-Cognac Lactone. The same procedure as above was applied to 11b (127 mg, 0.60 mmol). The crude product was purified by column chromatography on silica as above, and 12b (78.8 mg, 77%, 98:2 dr) was obtained as a colorless liquid. [ $\alpha$ ]<sub>0</sub><sup>20</sup> = -64.8 (c 1.23, CHCl<sub>3</sub>); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 4.41 (ddd, J = 9.4, 5.4, 4.4 Hz, 1H), 2.67 (dd, J = 17.0, 7.8 Hz, 1H), 2.52–2.60 (m, 1H), 2.17 (dd, J = 17.0, 4.0 Hz, 1H), 1.63 (q, J = 9.3 Hz, 1H), 1.45–1.53 (m, 2H), 1.26–1.39 (m, 5H), 0.99 (d, J = 7.3 Hz, 3H), 0.85–0.91 (m, 3H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>): δ 176.8, 83.6, 37.5, 32.9, 31.5, 29.8, 25.5, 22.4, 13.9, 13.7; IR 2956, 2865, 1779, 1462, 1423, 1383, 1335, 1294, 1212, 1168, 1079, 1006, 978, 932 cm<sup>-1</sup>; HRMS (ESI) calcd for C<sub>10</sub>H<sub>19</sub>O<sub>2</sub> [M + H]<sup>+</sup> 171.13796, found 171.13783.

(2S,6S)-2,6-Dichloroheptane-1,7-diol 14. To a solution of freshly distilled 1,7-heptandiol 13 (512 mg, 4.00 mmol) in MeCN (40 mL) were added CuOTf·4MeCN (149 mg, 0.30 mmol, 0.075 equiv), 2,2'-bipyridine (46.8 mg, 0.30 mmol, 0.075 equiv), TEMPO (46.8 mg, 0.30 mmol, 0.075 equiv), and 1-methylimidazole (49.7 mg, 0.60 mmol, 0.15 equiv). The reaction mixture was degassed for 5 min, and the atmosphere in the reaction vessel was replaced by O2. The reaction mixture was stirred for 3 h at rt, and (2R,5S)-2-(tert-butyl)-3,5-dimethylimidazolidin-4-one-TFA-salt (457 mg, 1.60 mmol, 0.40 equiv) and NCS (1.33 g, 10.0 mmol, 2.50 equiv) were added successively. The reaction was stirred for 18 h at rt, cooled to 0 °C, and diluted with EtOH (40 mL). After successive addition of NaBH<sub>4</sub> (756 mg, 20 mmol, 5.00 equiv) the reaction was stirred for 30 min at 0 °C, quenched by the addition of a saturated aqueous solution of  $NH_4Cl$  (20 mL), and extracted with EtOAc (3 × 60 mL). The combined organic layers were dried over MgSO4 and concentrated under reduced pressure. The crude product was purified by column

chromatography on silica (*n*-pentane/Et<sub>2</sub>O = 1:5), and 14 was obtained as a white solid (547 mg, 68%, 95:5 dr, >99:1 er). After recrystallization from CHCl<sub>3</sub>, the dr can be enriched to >99:1. Mp: 79.3 °C;  $[\alpha]_D^{20}$  = +51.1° (*c* 1.18, CHCl<sub>3</sub>); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 4.00–4.06 (m, 2H), 3.78–3.83 (m, 2H), 3.68–3.73 (m, 2H), 1.90 (br. s, 2H), 1.76–1.86 (m, 4H) 1.67–1.76 (m, 2H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>): δ 66.9 (2C), 64.6 (2C), 33.6 (2C), 23.3; IR 3324, 2962, 2866, 1455, 1391, 1286, 1073, 1020, 998, 745, 611, 568, 510, 455 cm<sup>-1</sup>; HRMS (ESI): m/z calcd for C<sub>7</sub>H<sub>15</sub>O<sub>2</sub>Cl<sub>2</sub> [M + H]<sup>+</sup> 201.04436, found 201.04433, calcd for C<sub>7</sub>H<sub>15</sub>O<sub>2</sub>Cl<sup>37</sup>Cl [M + H]<sup>+</sup> 205.03846, found 205.03825; GC (Hydrodex-β-TBDAC, 170 °C isotherm, 1.1 mL/min He, 50:1 split)  $T_{(2R,6R)}$  = 60.6 min,  $T_{(meso)}$  = 63.6 min,  $T_{(2R,6S)}$  = 70.5 min, isomeric ratio = 0:1:351.

**1,3-Di-((R)-oxiran-2-yl)propane 15.** To a solution of **14** (1.60 g, 7.69 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (27 mL) was added an aqueous solution of NaOH (1 M, 100 mL). After the reaction was stirred for 15 h at rt, the layers were separated and the aqueous layer was extracted with Et<sub>2</sub>O (3 × 100 mL). The combined organic layers were dried over MgSO<sub>4</sub> and concentrated under reduced pressure. The crude product was purified by column chromatography on silica (Et<sub>2</sub>O), and **15** was obtained as a colorless liquid (937 mg, 92%, 99:1 dr).  $[\alpha]_D^{20} = +23.0$  ( $\alpha$  1.1, EtOH); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):  $\alpha$  2.89–2.95 (m, 2H), 2.71–2.79 (m, 2H), 2.48 (dd,  $\alpha$  2 = 5.0, 2.7 Hz, 2H), 1.62–1.68 (m, 4H), 1.52–1.60 (m, 2H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\alpha$  52.0 (2C), 47.0 (2C), 32.2 (2C), 22.5; IR 2985, 2929, 2862, 1410, 1258, 1133, 911, 831, 764, 512 cm<sup>-1</sup>; HRMS (ESI):  $\alpha$  calcd for C<sub>7</sub>H<sub>13</sub>O<sub>2</sub> [M + H]<sup>+</sup> 129.09101, found 129.09072.
